

PROJECT: LAN SETUP & IP ADDRESSING

BY

NTIM FRANCIS GYAN

PROJECT OVERVIEW

- Designed and configured a functional LAN using Packet Tracer
- Devices used: 1 Router, 1 Switch, 5 PCs, 1 Printer
- IPv4 addressing implemented using both static and dynamic assignments
- Router configured as DHCP server
- Connectivity verified between all devices
- Documented IP addressing, MACs, topology, and testing results.

NETWORK DESIGN OVERVIEW

TOPOLOGY: *Star*

DEVICES:

Cisco Router

Cisco 2960 Switch

5 PCs

Network Printer

CONNECTIONS (Port → Device)

Router G0/0 → Switch G0/1

Switch Fa0/1 → PC1

Switch Fa0/2 → PC2

Switch Fa0/3 → PC3

Switch Fa0/4 → PC4

Switch Fa0/5 → PC5

Switch Fa0/6 → Printer

FIG 1 - Design of LAN with all end devices

IP ADDRESSING

IP ADDRESS TABLE

DEVICE	MAC ADDRESS	IP ADDRESS	TYPE	SUBNET MASK	GATEWAY
Router (G0/0)	—	192.168.10.1	Static	255.255.255.0	—
Switch VLAN1	—	192.168.10.5	Static	255.255.255.0	192.168.10.1
Chrys_PC	00E0.F9D1.095A	192.168.10.2	Static	255.255.255.0	192.168.10.1
Kelvin_PC	0009.7CE7.19A7	192.168.10.3	Static	255.255.255.0	192.168.10.1
Printer	000C.85C2.5C26	192.168.10.4	Static	255.255.255.0	192.168.10.1
Emma_PC	0009.7C3A.9E8D	DHCP (192.168.10.6)	Dynamic	255.255.255.0	192.168.10.1
Edward_PC	0002.163B.297D	DHCP (192.168.10.7)	Dynamic	255.255.255.0	192.168.10.1
Sarah_PC	0060.3EAD.56CC	DHCP (192.168.10.8)	Dynamic	255.255.255.0	192.168.10.1

CONFIGURATION STEPS

ROUTER CONFIGURATION:

Enter privileged mode:

enable

configure terminal

Set router hostname:

hostname Office_Router

Configure LAN interface:

interface g0/0

ip address 192.168.10.1 255.255.255.0

no shutdown

exit

Configure DHCP excluded addresses:

ip dhcp excluded-address 192.168.10.1 192.168.10.5

Create DHCP pool:

ip dhcp pool OFFICE

network 192.168.10.0 255.255.255.0

default-router 192.168.10.1

dns-server 8.8.8.8

domain-name local.office

exit

Save the configuration:

end

write memory

SWITCH CONFIGURATION

Enter privileged mode:

enable

configure terminal

Set switch hostname:

hostname Office_Switch

Configure VLAN 1 management interface:

interface vlan 1

ip address 192.168.10.5 255.255.255.0

no shutdown

exit

Set switch default gateway:

ip default-gateway 192.168.10.1

Save configuration:

end

write memory

END DEVICE CONFIGURATION

Static Devices

Chrys_PC:

- *IP Address: 192.168.10.2*
- *Subnet Mask: 255.255.255.0*
- *Default Gateway: 192.168.10.1*

Kelvin_PC:

- *IP Address: 192.168.10.3*
- *Subnet Mask: 255.255.255.0*
- *Default Gateway: 192.168.10.1*

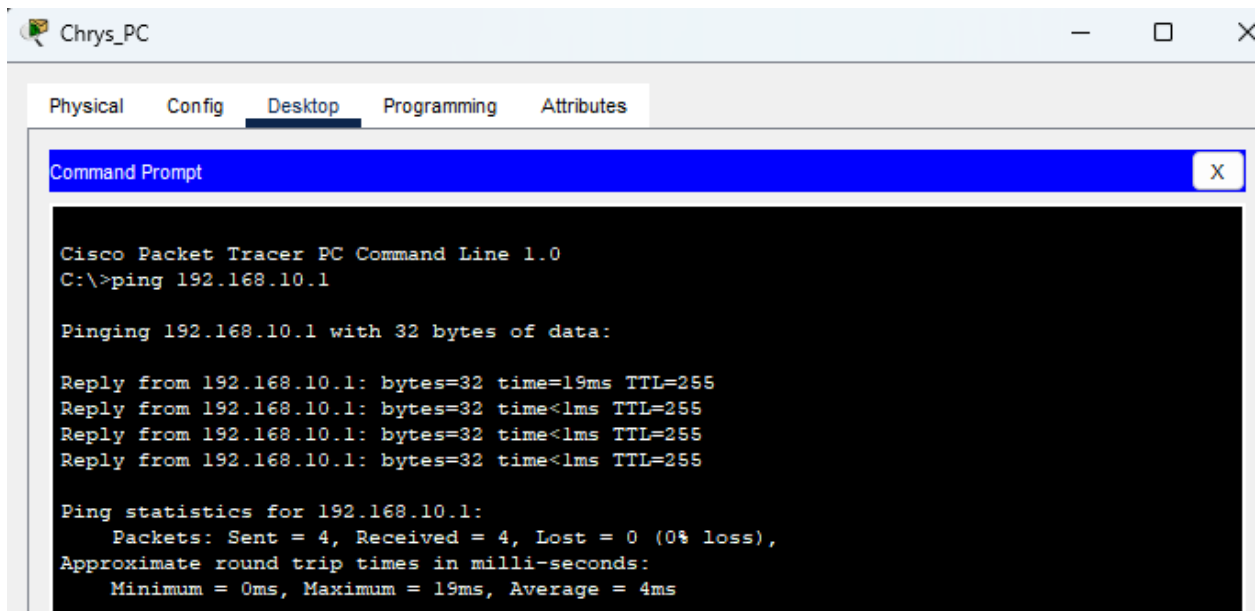

Printer:

- *IP Address: 192.168.10.4*
- *Subnet Mask: 255.255.255.0*
- *Default Gateway: 192.168.10.1*

DHCP Devices (PC3–PC5)

- *Go to Desktop → IP Configuration → Click DHCP*
- *Emma_PC automatically received 192.168.10.6*
- *Edward_PC received 192.168.10.7 automatically*
- *Sarah_PC received 192.168.10.8 automatically*

TESTING & VERIFICATION

The screenshot shows the Cisco Packet Tracer interface with the 'Desktop' tab selected. A Command Prompt window is open, displaying the output of a ping command to 192.168.10.1. The output shows four successful replies with a time of 19ms and TTL of 255. The statistics indicate 4 packets sent, 4 received, and 0% loss.

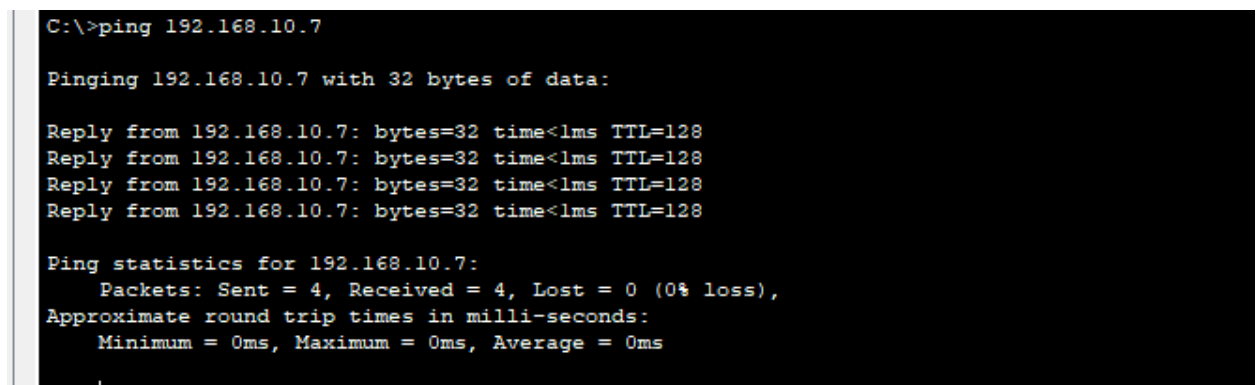

```
Cisco Packet Tracer PC Command Line 1.0
C:\>ping 192.168.10.1

Pinging 192.168.10.1 with 32 bytes of data:

Reply from 192.168.10.1: bytes=32 time=19ms TTL=255
Reply from 192.168.10.1: bytes=32 time<1ms TTL=255
Reply from 192.168.10.1: bytes=32 time<1ms TTL=255
Reply from 192.168.10.1: bytes=32 time<1ms TTL=255

Ping statistics for 192.168.10.1:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 19ms, Average = 4ms
```

*FIG 2 - pinging the router gateway: **ping 192.168.10.1***

The screenshot shows the Cisco Packet Tracer interface with the 'Desktop' tab selected. A Command Prompt window is open, displaying the output of a ping command to 192.168.10.7. The output shows four successful replies with a time of 0ms and TTL of 128. The statistics indicate 4 packets sent, 4 received, and 0% loss.

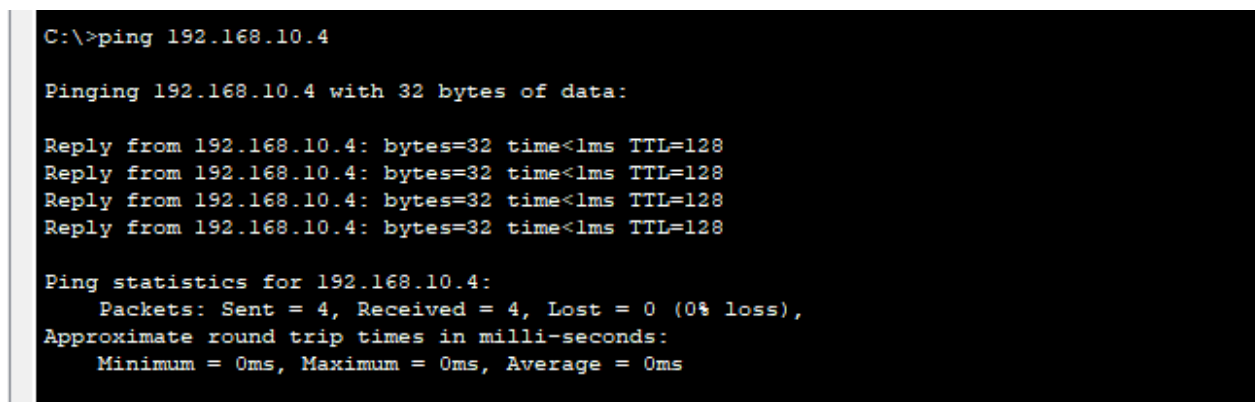

```
C:\>ping 192.168.10.7

Pinging 192.168.10.7 with 32 bytes of data:

Reply from 192.168.10.7: bytes=32 time<1ms TTL=128
Reply from 192.168.10.7: bytes=32 time<1ms TTL=128
Reply from 192.168.10.7: bytes=32 time<1ms TTL=128
Reply from 192.168.10.7: bytes=32 time<1ms TTL=128

Ping statistics for 192.168.10.7:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 0ms, Average = 0ms
```

*FIG 3 - pinging Edward PC on Chrys PC: **ping 192.168.10.7***

The screenshot shows the Cisco Packet Tracer interface with the 'Desktop' tab selected. A Command Prompt window is open, displaying the output of a ping command to 192.168.10.4. The output shows four successful replies with a time of 0ms and TTL of 128. The statistics indicate 4 packets sent, 4 received, and 0% loss.

```
C:\>ping 192.168.10.4

Pinging 192.168.10.4 with 32 bytes of data:

Reply from 192.168.10.4: bytes=32 time<1ms TTL=128
Reply from 192.168.10.4: bytes=32 time<1ms TTL=128
Reply from 192.168.10.4: bytes=32 time<1ms TTL=128
Reply from 192.168.10.4: bytes=32 time<1ms TTL=128

Ping statistics for 192.168.10.4:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 0ms, Average = 0ms
```

*FIG 4 - pinging the printer: **ping 192.168.10.4***

```

```

FIG 7 - Checking mac address table on the switch: show mac address-table

LESSONS LEARNED

1. Proper IP planning (including excluded addresses) prevents conflicts and reserves space for infrastructure devices.
2. Printers and other shared/service devices must use static IPs for reliability and ease of management.
3. Switches learn MAC addresses dynamically only when traffic flows; pings are required to populate the MAC address table in Packet Tracer.
4. Basic router commands (interface config, DHCP pool, default-gateway) are sufficient to turn a router into a fully functional gateway for a small LAN.
5. Systematic testing (ping, show ip dhcp binding, show mac address-table) is essential to prove the network works as intended.

CONCLUSION

This project successfully designed, configured, and verified a small office network using a Cisco router, Layer-2 switch (2960), 5 PCs, and a shared printer. All devices were able to communicate within the 192.168.10.0/24 subnet, with the router providing DHCP services and Internet-bound connectivity, while static addressing was correctly applied to critical devices (router, switch management, and printer).

Connectivity and Layer-2/Layer-3 functionality were confirmed through successful pings and populated MAC address and DHCP binding tables.
